FROM RAW BILLET TO SURGICAL PRECISION

The Art & Science of Manufacturing

Every MIM Instruments instrument undergoes a meticulous 6-stage engineering and hand-articulation workflow.

1

Precision Hot Die Forging

European and Japanese surgical steel billets are heated in induction furnaces and forged under drop hammers to align the internal grain structure, providing superior tensile strength and preventing micro-fractures under mechanical stress.

2

5-Axis CNC Milling & Wire EDM

Computer-controlled wire electrical discharge machining (EDM) shapes microscopic serrations, box joints, and ratchet steps within ±0.01 mm tolerances, guaranteeing uniform jaw intermeshing across all production batches.

3

Vacuum Heat Treatment & Cryogenic Quenching

Instruments are hardened in vacuum chambers to prevent decarburization, followed by sub-zero cryogenic quenching. This achieves optimal Rockwell hardness (50–54 HRC for body; 60+ HRC for cutting blades) for enduring edge retention.

4

Hand Articulation & Master Filing

Machines cut the metal, but human hands make the surgical instrument. Master artisans with decades of experience individually file, set pivot friction, align ratchet catches, and calibrate spring resistance for effortless single-handed release.

5

Electrochemical Passivation (ASTM A967)

A multi-stage chemical passivation bath leaches free iron from the surface, forming a self-healing, chromium oxide barrier layer that withstands corrosive autoclave steam and enzymatic disinfectants.

6

Laser Annealing & UDI Identification

Permanent, corrosion-proof fiber laser markings are applied, including the MIM Instruments logo, reference SKU, batch lot, and GS1-compliant DataMatrix barcode for seamless hospital theater tracking.

MATERIAL SCIENCE & ENGINEERING

Surgical Metallurgy & Alloys

Every surgical instrument is engineered from specifically formulated alloy compositions to match its clinical function.

Martensitic Stainless Steels

AISI 410, 420A / 420B / 420C (DIN 1.4021 / 1.4028)

High-carbon martensitic stainless steel capable of undergoing thermal hardening. Provides exceptional tensile strength, edge retention, and elasticity. Used extensively in artery forceps, needle holders, hemostats, and bone chisels.

Austenitic Stainless Steels

AISI 304, 316L (DIN 1.4301 / 1.4404)

High-nickel chromium alloys offering superior corrosion resistance and non-magnetic properties. Extremely ductile and fatigue-resistant. Used for surgical retractors, suction tubes, hollowware, and sterilization trays.

Tungsten Carbide (TC) Inlays

Gold Rings Indicator (Rockwell HRC 68–72)

Micro-grain tungsten carbide plates are vacuum-brazed to the working tips and blades. Provides up to 5x longer cutting life on scissors and eliminates needle slippage on needle holders without damaging suture filaments.

SuperCut Micro-Bevel Technology

Black Rings Indicator

Features one razor-sharp knife blade paired with a micro-fine serrated counter-blade. This design traps tissue securely without slipping, executing effortless, clean dissection through dense fibrous structures.

Mechanical & Chemical Properties Guide

ALLOY GRADE	TYPICAL APPLICATION	HARDNESS RANGE	KEY CHARACTERISTIC
AISI 420B	Dissecting Scissors, Forceps	52–56 HRC	Superior edge sharpness & wear resistance
AISI 410	Hemostatic Clamps, Retractors	46–50 HRC	High ductility, flexural resilience without snap
AISI 316L	Cannulas, Suction Tubes, Trays	Non-hardened	Immunity to pitting in saline environments
Tungsten Carbide	TC Needle Holders & TC Scissors	68–72 HRC	Diamond-hard jaw serrations & cutting edges
Titanium Ti-6Al-4V	Microsurgery, Ophthalmology	36–40 HRC	100% non-magnetic, 45% lighter than steel

HOSPITAL INFECTION CONTROL PROTOCOLS

Reprocessing & Sterilization Guide

Standardized instructions to preserve instrument longevity, edge sharpness, and complete sterility.

1. Point of Use Pre-Treatment

Rinse instruments immediately following surgery with sterile demineralized water or apply enzymatic foam. **Never** allow blood, saline, or tissue bioburden to dry on the instruments, as chlorides rapidly induce pitting corrosion.

2. Ultrasonic Cleaning

Immerse instruments fully open in an ultrasonic bath for 5–10 minutes at 35–45 kHz using neutral pH enzymatic detergent (pH 7.0–8.5). Ensure dissimilar metals (aluminum, brass) are not mixed in the same cycle.

3. Rinsing & Thorough Drying

Rinse thoroughly using reverse osmosis (RO) or demineralized water to remove all chemical residues. Dry completely using medical lint-free towels or compressed medical air, giving special attention to box joints and lumens.

4. Medical Lubrication

Apply a water-soluble, vapor-permeable medical instrument lubricant (instrument milk) to all articulating pivots, box joints, and ratchets before autoclaving. Never use industrial or mineral-oil lubricants.

Recommended Autoclave Steam Sterilization Parameters

CYCLE METHOD	STERILIZATION TEMP	EXPOSURE TIME	MINIMUM DRYING TIME
Pre-Vacuum (Fractionated)	134°C (273°F)	4 – 5 minutes	20 – 30 minutes
Gravity Displacement	121°C (250°F)	30 minutes	30 – 45 minutes
High-Vacuum (UK / EU Standard)	134°C (273°F)	3.5 minutes (min. hold)	20 minutes

CAUTION: Never use bleach, household disinfectants, hydrochloric acid, or abrasive scouring pads. Such chemicals strip the protective chromium oxide passivation layer and cause irreversible rusting and joint seizure.

An Overview On
Forcep Jaw Types

You will see that forceps in our catalogue will have either a traditional serrated jaw or a different design which is known as atraumatic (or non-traumatic).

Traditional Serrated Jaw

The traditional serrated jaw is generally more robust and used on forceps where the areas are not as delicate.

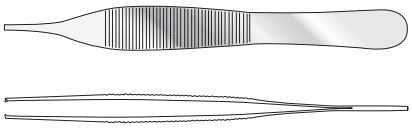

Atraumatic Jaw

Atraumatic jaws will be mainly found in delicate surgery areas such as vascular and cardiothoracic. The design is such, that the surface area gripped is reduced, ensuring less trauma without the loss of grip.

Choosing the most suitable needle size

Our tungsten carbide inserts are available in a variety of styles. Choosing the most suitable needle size for each procedure helps give the surgeon maximum grip and control.

Coarse 0.65mm
For powerful needle holder patterns and wire twisters. Maximum holding capabilities for heavy needles or wire.

Standard 0.5mm
Used, for example, in Mayo-Hegar, Mathieu Needle Holders. For needles 3-0 and larger.

Fine 0.4mm
For delicate needle holders such as Crile-Wood and DeBakey. For needles and sutures between 4-0 and 6-0.

Micro 0.2-0.3mm
For micro needle holders such as Castroviejo, Microvascular and Mini-Ryder. For delicate needles and sutures between 7-0 and 10-0.

Smooth
Smooth tungsten carbide surface reduces damage to delicate needles and suture of 6-0 and finer.

The difference between Monopolar Electrosurgery and Bipolar Electrosurgery

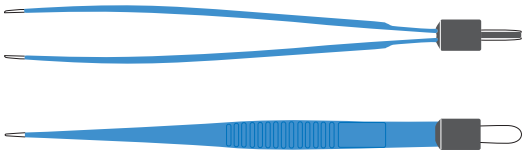

There is one basic difference between bipolar and monopolar techniques. With monopolar electrosurgery, a probe electrode is used to apply the electrosurgical energy to the target tissue to achieve the desired surgical effect. The current then passes through the patient to a return pad and then back to the ESU generator to complete the circuit.

With the bipolar electrosurgical method a bipolar device, often a set of forceps, is used. The electrical current passes from one side of the forcep, through the target tissue to the other side of the forcep, then back to the generator. The electrical current is restricted to the tissue between the forcep, therefore not requiring the use of a grounding pad.

Did you know...

The history of our family business

We've had a long tradition of surgical instrument makers in the Coole family, going back way before our Managing Director, Daniel, was even born.

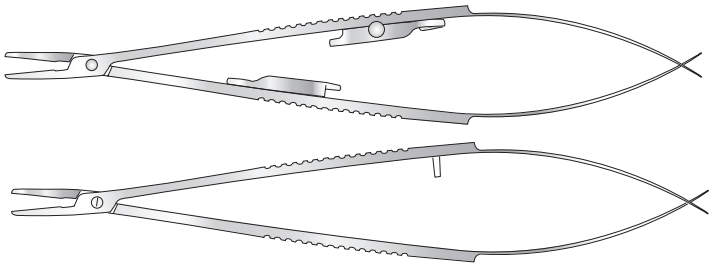

Fred Coole, started his ophthalmic instrument making business back in 1940. Instrument workshops used to be in the West End of London, close to key hospital sites.

Instrument makers would go to work dressed in 3 piece suits, as they would have to walk through showrooms where surgeons would be viewing instruments.

Artery Clamps

An Overview On
Atraumatic Jaws

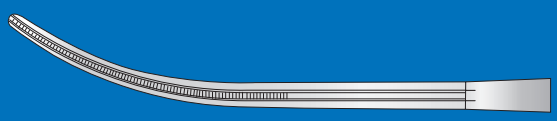

Also known as non-traumatic, atraumatic jaws will be mainly found in delicate surgery areas such as vascular and cardiothoracic. The design is such, that the surface area gripped is reduced, ensuring less trauma without the loss of grip.

Atraumatic jaws are available as straight or curved.
